

Green House Gas (GHG) Emissions Control

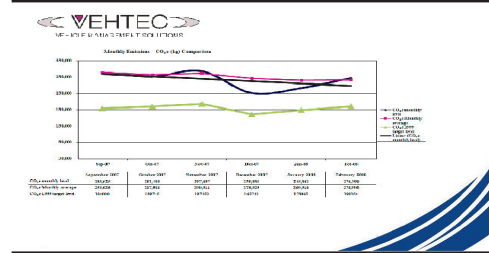

VEHTEC maintains a strong commitment to the environment, and through our total fleet management services have been effective in assisting our clients in measuring and monitoring their GHG emissions through:

- Providing performance results of their fleet emissions against previously recorded data. This graphical report assists in the monitoring and management of GHG emissions, and evidences performance as a result of changes, modifications and adjustments recommended and made to both vehicles and operations;
- Ensuring vehicle and plant servicing and maintenance is carried out in accordance with manufacturers scheduled service criteria, this ensuring the fleet units are operating at their most fuel efficient level;
- Individual vehicle assessment of fleets ensuring that all vehicle's and plant are fit for purpose. Resultant utilisation recommendations often reduce the fleet numbers, whilst improving efficiencies; and
- Monitoring the utilisation of fleet units, whilst simultaneously reducing the cost per kilometre to operate the vehicles and plant. This operational cost savings can be utilised towards emissions reduction initiatives (i.e. CNG conversions) or used to offset Carbon trading values.

Investing in the future, **VEHTEC** Research & Development is currently assessing a prototype GHG emissions monitoring system which will provide factual GHG emission data for your fleet vehicles. Data gathered will verify and validate you meet or exceed target reductions set by the Australian Greenhouse Office.

VEHTEC is an active participant in the Greenfleet program, and supports all activities promoting the reduction of GHG emissions in Australia.

VEHTEC fleet management reporting suite incorporates a GHG emissions summary chart which can be used to monitor GHG emissions against Australian Greenhouse Office (AGO) targets.
